

# Is there a way to detect and prevent the possibility of heart attack or stroke?

The 40-year-old lipid panel used by most physicians to identify risk for heart attack is accurate in predicting risk only 40% of the time and has no ability to identify stroke risk.

## **The HunterHeart® Program.**

The HunterHeart program uses the most advanced technology available to assess the risk of heart disease, stroke and dementia.

This program tests for:

- Advanced risk markers for both heart attack and stroke
- Arterial inflammation and rupture prone plaque, which are key to predicting near term events
- Genetic testing, to assess your risk and to optimize treatment by predicting your response to specific drugs, types of diet and exercise
- Equally important, this program provides a therapy guide based upon each patient's primary cause of risk to assist physicians with the full scope of therapies available to treat the specific causes of risk.
